*Diagnostic Hematology* Little, Brown Medical Division

With the 13th edition, Wintrobe's Clinical Hematology once again bridges the gap between the clinical practice of hematology and the basic foundations of science. Broken down into eight parts, this book provides readers with a comprehensive overview of: Laboratory Hematology, The Normal Hematologic System, Transfusion Medicine, Disorders of Red Cells, Hemostasis and Coagulation; Benign Disorders of Leukocytes, The Spleen and/or Immunoglobulins; Hematologic Malignancies, and Transplantation. Within these sections, there is a heavy focus on the morphological exam of the peripheral blood smear, bone marrow, lymph nodes, and other tissues. With the knowledge about gene therapy and immunotherapy expanding, new, up-to-date information about the process and application of these therapies is included. Likewise, the editors

have completely revised material on stem cell transplantation in regards to both malignant and benign disorders, graft versus host disease, and the importance of long-term follow-up of transplantation survivors.

Chapters have been combined and restructured to match the changes that have occurred in the clinical laboratory. Plus, the contributors continue to be the leaders in the field of clinical chemistry. Other text features include outlines, objectives, case studies, practice questions and exercises, a glossary and more.

*Clinical Hematology and Fundamentals of Hemostasis* Lippincott Williams & Wilkins

The approach described in this book is different from that in most student texts, and has been very successful in practice, starting almost from scratch, but omitting many of the 'basics' such as the details of hematopoiesis, laboratory technology, and so on, which are hardly relevant to the practising clinician and student in the wards, and are primarily of interest to the hematologist and sometimes to the clinical specialist. Considerable emphasis is given to the clinical history and examination, and the interpretation of the clinical patterns thus exposed. Hopefully it will overcome many of the traditional problems experienced in practical diagnostic haematology.

**Color Atlas of Hematology** Oxford University Press

This book covers a wide array of hematologic problems commonly encountered in the daily practice of critical care and emergency medicine.

Unfortunately, the symptoms and signs associated with underlying hematologic disorders are frequently rather unspecific and confounding; furthermore, the clinical course of patients admitted to intensive care units with such disorders can be fulminant, warranting prompt diagnosis. This book recognizes the importance of accurate and speedy interpretation of symptoms in that the text is symptom oriented rather than disease oriented. Put another way, the reader confronted with a particular clinical problem or symptom will be guided step by step to the possible underlying disorder(s). The scenarios considered include critical illness in patients with anemia, leukopenia, leukocytosis, abnormal platelet count, and severe transfusion reactions. For each circumstance, factors relevant to symptom interpretation are fully discussed. In addition, helpful diagnostic algorithms are presented in the form of flow charts that will assist in decision making regarding the need for further investigations. The closing chapter is devoted to the drug-induced hematologic disorders. Although the book is intended mainly for intensivists, other specialists will find much information of value for their daily practice.
