Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting

features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Parasitology provides all the basic principles of this increasingly studied subject, emphasised by specific, but important examples rather than covering organisms of just one particular group. It is ideally suited to the new modular/semester system now used by most universities and is laid out in the form of 'notes' (rather than detailed descriptions), accompanied by simple flow charts and diagrams. Each chapter begins with a list of keywords and concepts. Where appropriate data from research papers is used to illustrate and emphasise the points.

This concise but thorough study of courtship behavior in fish, birds, and arthropods is the first rigorous examination of the evolutionary origins and mechanisms of courtship and its contribution to biological success. Demonstrating the fruitfulness of an empirically based, inductive approach to understanding courtship, the book also explains clearly how principles of modern evolutionary theory can be successfully employed in studying behavior. The author describes many observations and experiments that have not previously appeared outside specialized journals and brings an abundance of simple yet accurate examples of animal behavior to bear on explanations of ethological

concepts and evolutionary theory. No attempt is made to skim over the gaps of knowledge apparent in the study of behavior evolution; rather, the author discusses the limitations and difficulties of different approaches, critically reviews the deductions that can be and have been made from them, and tries to present enough evidence on controversial points for the reader himself to judge the validity of specific arguments. Indicating how ethological method, firmly based on biological principles, can intensively investigate and illuminate a single area of animal behavior, the book will be valuable to students and professionals in zoology, animal behavior, and experimental psychology.
