Fundamentals of Press Brake Tooling: The Basic Information ... Press brake forming is a process which employs a press brake for the bending operation. A press brake contains an upper tool called the punch and a lower tool called the die, between which the sheet metal is located. The sheet is carefully positioned over the die while the punch is lowered and forces the sheet to bend. CHAPTER 4 FUNDAMENTALS OF BENDING 4.1 INTRODUCTION To maximize the press brake tooling's life, select the right tooling for the application. Tooling life depends on the nature of the material being formed. Checkered plate and materials with a lot of mill scale can shorten tooling life considerably as these materials do not flow easily during forming and create a drag on the tooling—wearing it down as a result. The fundamentals of press brake maintenance Sheet metal bending press-brakes can be setup to produce more than one type of part without requiring a setup change. To exploit this flexibility, we need setup planning techniques so that press-brake setups can be shared among many different parts.
