Approached from a real-world perspective, the handbook is a portable guide that provides sufficient scientific background to facilitate broader application and problem solving yet approach the topic in a prioritized fashion, supporting rapid understanding and utilization. Tactical Combat Casualty Care (TCCC) has saved hundreds of lives during our nation's conflicts in Iraq and Afghanistan. Nearly 90 percent of combat fatalities occur before a casualty reaches a medical treatment facility. Therefore, the prehospital phase of care is needed to focus on reducing the number of combat deaths. However, few military physicians have had training in this area and, at the onset of hostilities, most combat medics, corpsmen, and pararescue personnel in the U.S. military have been trained to perform battlefield trauma care through civilian-based trauma courses. These courses are not designed for the prehospital combat environment and do not reflect current practices in the area of prehospital care. TCCC was created to train Soldiers and medical personnel on current best practices for medical treatment from the point of injury to evacuation to Role 3 facilities

The second edition of *Front Line Surgery* expands upon the success of the first edition, providing updated discussion of practical management of commonly encountered combat injuries. This edition

reflects the cutting edge of combat casualty care, refined principles of surgical management of specific injury patterns, and incorporation of the spectrum of recent research advancements in trauma care. Each chapter continues to follow the same organization as the first edition. The “BLUF”, or bottom line up front, headlines each topic, providing the critical pearls for the reader, followed by a focused and straight forward discussion of management, pitfalls, and recommendations. In addition, select chapters conclude with a section discussing the application of this topic in civilian practice, as potentially encountered by the rural or humanitarian relief surgeon. Additional new topics include: REBOA and endovascular techniques for hemorrhage control, updates in transfusion and resuscitation practice, active shooter situations, rural trauma management in developed nations, advancements in prehospital care and the Tactical Combat Casualty Care (TC3) course, and discussion of the newest generations of topical hemostatic agents and tourniquets. These additions serve to both enhance the breadth and depth of the material relevant to military surgeons, but should also further expand the applicability and interest in this work to all civilian trauma surgeons.

This text is designed to present a comprehensive and state-of-the-art approach to dismantled

complex blast injuries. Sections address care of these patients from the point of injury through rehabilitation. The specific areas addressed include blast mechanics, stabilization and hemorrhage control at the point of injury, early resuscitation at local hospitals, a systematic approach to surgical care, and finally reconstruction and rehabilitation. Specific chapters focus on operative management of pelvic, abdominal, genitourinary, orthopedic, neurological and thoracic injuries. The authors of each chapter, are experts in treating DCBIs that have had direct hands-on experience through military deployments in Iraq and Afghanistan. Each chapter describes patient presentation and an algorithm outlining treatment with support from the literature. The text will conclude with three chapters. The first explores new advances in care that can be applied to these injuries. The second highlights the organization and team approach to care of these patients. Finally, the last chapter describes an actual case, cared for by the editors, that encompasses points from the chapters in the text. Extensive illustrations and flow diagrams are used throughout the text. This text is specifically designed to be a "how to" guide for inexperienced military and civilian providers. The chapters are organized in a step-wise fashion that mirrors the patient's course from point of injury through their hospital course. Combining authors' experience with illustrations and algorithm diagrams creates a text that is easy to use as a reference text or basis of training for future military and civilian surgeons.
