 "Two primary components present in Clinical Management Notes and Case Histories in Cardiopulmonary Physical Therapy are notes on cardiopulmonary assessment and management, and case histories involving respiratory and cardiovascular conditions commonly viewed by

physical therapists. Accompanying the notes are thought-provoking questions and problems that enable the reader to establish a foundation of core concepts. The presentation of case histories further facilitates the development of integral skills and enables the reader to integrate those core concepts into a clinical setting. Also, question and answer guides accompany the patient profiles."--BOOK JACKET.

This work is devoted to the theory and approximation of nonlinear hyperbolic systems of conservation laws in one or two space variables. It follows directly a previous publication on hyperbolic systems of conservation laws by the same authors, and we shall make frequent references to Godlewski and Raviart (1991) (hereafter noted G. R.), though the present volume can be read independently. This

earlier publication, apart from a first chapter, especially covered the scalar case. Thus, we shall detail here neither the mathematical theory of multidimensional scalar conservation laws nor their approximation in the one-dimensional case by finite-difference conservative schemes, both of which were treated in G. R. , but we shall mostly consider systems. The theory for systems is in fact much more difficult and not at all completed. This explains why we shall mainly concentrate on

some theoretical aspects that are needed in the applications, such as the solution of the Riemann problem, with occasional insights into more sophisticated problems. The present book is divided into six chapters, including an introductory chapter. For the reader's convenience, we shall resume in this Introduction the notions that are necessary for a self-sufficient understanding of this book -the main definitions of hyperbolicity, weak solutions, and entropy

present the practical examples that will be thoroughly developed in the following chapters, and recall the main results concerning the scalar case.

The mid-seventeenth century saw both the expansion of the Baptist sect and the rise and growth of Quakerism. At first, the Quaker movement attracted some Baptist converts, but relations between the two groups soon grew

hostile. Public disputes broke out and each group denounced the other in polemical tracts.

Nevertheless in this book, Underwood contends that Quakers and Baptists had much in common with each other, as well as with the broader Puritan and Nonconformist tradition. By examining the Quaker/Baptist relationship in particular, Underwood seeks to understand where and why Quaker views diverged from English Protestantism in general and, in the process, to

clarify early Quaker beliefs.

This book places character theory and its applications to finite groups within the reach of people with a comparatively modest mathematical background. The work concentrates mostly on applications of character theory to finite groups. The main themes are degrees and kernels of irreducible characters, the class number and the number of nonlinear irreducible characters, values of irreducible characters, characterizations and

generalizations of Frobenius groups, and generalizations of monomial groups. The presentation is detailed, and many proofs of known results are new.
